                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated nucleic acid that encodes a PRO polypeptide. The methods and compositions of the present invention are useful for the diagnosis, prevention and/or treatment of inflammation, nephropathies, bone and cartilage disorders, such as arthritis and disorders that affect glucose or free fatty acid (FPA) uptake, such as diabetes, hypoinsulinaemia or hyperinsulinaemia. The PRO polypeptides are also useful as molecular weight markers or for chromosome identification. The PRO genes are useful as hybridiastion probes or for screening libraries of human cDNA, genomic DNA or mRNA. The PRO genes may also be used in gene therapy and antisense therapy. The present sequence is a PCR primer used in the isolation of human PRO cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; diagnosis; inflammation; nephropathy; bone disorder; arthritis; cartilage disorder; hypoinsulinaemia; hyperinsulinaemia; gene therapy; antisense therapy; diabetes; PRO; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              26-DEC-2001;

The methods and compositions of the present invention ar useful for the diagnosis, prevention and/or treatment of inflammation, nephropathies, bone and cartilage disorders such as arrhrits and disorders that affect glucose or free fatty acid (FFA) uptake such as diabetes, hypoinsulinaemia and hyperinsulinaemia. The PRO peptides are useful as molecular weight markers and for chromosome identification. The PRO genes may also be used in gene therapy and antisense therapy. The present sequence is a PCR primer used to isolate human PRO cDNA

```

The invention describes an isolated secreted and transmembrane PRO polypeptide (I) having at least 80% amino acid sequence identity to fully defined sequences of 246, 440, 197, 97, 273, 571, 209, 888, 502, 310, 251, 800, 507, 248, 223, 114, 116, 468, 322, 221, 194, 125 or 339 amino acids as given in the specification. (I) is useful for tissue typing, as

۲,

ation. (I) is useful for tissue typing, as therapeutic agents. A polynucleotide (II)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 encoding (I) is useful for chromosome identification, gene therapy, tissue typing or as hybridisation probes in chromosome and gene mapping. PRO1484, PRO1890, PRO1887, PRO4357, PRO4405, PRO5737 and PRO5990 is useful for treating sports injuries and arthritis. PRO1484, PRO1112, PRO1889, PRO4357, PRO4390 and PRO4356 are useful for treating diabetes. PRO4334, PRO4425, PRO43430, PRO1890, PRO1785 and PRO4222 are useful for treating obesity, diabetes or hyper- or hypo-insulinaemia. PRO4352, PRO4354, PRO4408, PRO6030 and PRO4499 are useful for treating thalassaemia. PRO4350, PRO4408 and PRO4425 are useful for treating disease, Schonlein-Henoch purpura, celiac disease, dermatitis herpetiformis or Crohn's disease. This sequence represents a novel human secreted and transmembrane PRO polypeptide associated primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ACA06142 standard; DNA; 22

                                                                                                                                                                                                       The present invention relates to the isolation of novel human PRO CC polypeptides, and the polynucleotide sequences encoding them. The PRO CC polypeptides are secreted and transmembrane proteins. The PRO CC polypeptides and polynucleotides are useful in diagnosing or treating CC various bone and/or cartilage disorders (e.g. sports injuries, CC hypo-insulinaemia), obesity, hyper-insulinaemia, hammoglobin-associated with CC disorders (e.g. thalassaemias), kidney disorders associated with CC decreased mesangial cell function (e.g. Berger disease), or other cc mephropathies associated with Schonlein-Henoch purpura, celiac disease, CC dermatitis herpetiformis or Crohn's disease. The PRO polynucleotide cc mapping, or in generating antisense RNA and DNA. They are also useful in CC preparing PRO polypeptides, in assays to identify other proteins or CC molecules involved in binding reaction, to generate transgenic animals or Knockout animals, which in turn are useful in the development and cc screening of therapeutically useful reagents, for chromosome CC identification, and tissue typing. The PRO polypeptides and nucleic acid colecules are also useful in gene therapy, and as molecular weight consecution of the polypeptides from recombinant cell culture or natural cultures. The present sequence represents a PCR primer used in the creation of the polypeptides from recombinant cell culture or natural cc examples of the present sequence represents a PCR primer used in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         polynucleotide is useful in molecular biology, including uses as hybridisation probes, in chromosome and gene mapping, in generating antisense RNA and DNA, and in gene therapy. The polynucleotide may also be used in preparing PRO polypeptides by recombinant techniques, and in generating either transgenic animals or knock-out animals which, in turn are useful in the development and screening of therapeutically useful reagents. This sequence represents a primer used to isolate DNA encoding a novel human secreted and transmembrane PRO proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Twenty three nucleic acids encoding PRO polypeptides, useful chromosome and gene mapping, in generating antisense RNA and gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention describes 23 nucleic acids encoding human secreted transmembrane PRO polypeptides. The PRO polypeptides and nucleic are useful for the therapeutic treatment of cancerous tumours. The treatment of cancerous tumours of the cancerous tumours.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC act sequentially on a substrate of interest and are derived from one or common drug metabolising enzymes (DMEs). Also described: (1) a method of comaking a protein array; (2) an array made by the method of (1); (3) a cc method of screening a set of protein moieties for molecules which continues the relative properties of members of a set of protein cc moieties; and (5) a method of expressing and purifying a DME. The protein cc array is useful in examining gender differences in drug metabolism, cc ethnicity-related differences in drug metabolism and toxicity between two cr more mammalian species, e.g. human and rat and cytotoxicity of drug metabolites, in defining and quantifying metabolic pathways for small conjunction, in screening of compounds that binds and inhibits individual compounds of interest and the effects of mutation on the activity of a compounds of interest and the effects of mutation on the activity of a conjuncyphic variant of a human cytochrome p450 enzyme, which is used in an annual argument a permise for a human cytochrome p450 enzyme, which is used in the contraction of p450 enzyme, which is used in the contraction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

The present sequence was used to illustrate the invention
                                                    The present invention relates to a method (M1) for obtaining a bifunctional complex. (M1) comprises a display molecule part and a coding part, where a nascent bifunctional complex comprising a chemical reaction site and a priming site for enzymatic addition of a tag is reacted at the chemical reaction site with reactant(s), and provided with respective tag(s) identifying the reactant(s) at the priming site using one or more enzymes. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                               Obtaining bifunctional complex with display molecule and coding part, where bifunctional complex with priming site for adding tag is reacte reaction site with reactants and provided with tag identifying reacta

                                                                                                                                                                                                                          an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid arthritis, lugus, inflammatory bowel diseases, multiple sclerosis, HIV/AIDS or viral, bacterial or fungal infection. The present sequence represents a primer for a 50 mer oligonucleotide marker for diagnosis and monitoring of allograft rejection and other disorders.
                                                                                                                                                                                                                                                                                                              rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic slet, lung, bone marrow or stem cell transplant rejection, in an exenctransplant rejection or mechanical organ replacement rejection, in an individual. The method is also useful in assessing the immune status of

The invention relates to a pharmaceutical composition for treating a condition disease associated with one or more self-molecules present non-comprising an individual (e.g., autoimmune present non-comprising an immune modulatory nucleic acid (INS, immune modulatory sequence) comprising a hexamer region of the formula 5'-purine-pyrimidine-[X]-[Y]-yrimidine-pyrimidine-3', where X and Y are any naturally-occurring or synthetic nucleotides except cytosine-guanine, and a pharmaceutical carrier. The immune modulatory nucleic acid may also contain a polyg cregion linked 5' and/or 3' to the hexamer region. The invention also crelates to a nucleic acid composition comprising a nucleic acid vector carrier at least one cytosine to non-cytosine substitution (preferably C to G) within a CpG motif, wherin the CpG motif is of the formula: (a) 5'-to G) within a CpG motif, wherin the CpG motif is of the formula: (a) 5'-to G) within a CpG motif, wherin the CpG motif is of the formula: (a) 5'-to G) within a CpG motif, wherin the CpG motif is of the formula: (a) 5'-to G) within a CpG motif, wherein the CpG motif is of the formula: (a) 5'-to G) within a CpG motif, wherein the CpG motif is of the formula: (a) 5'-to G) within a CpG motif, wherein the CpG motif is of the formula: (a) 5'-to G) within a CpG motif, wherein the CpG motif is of the formula: (a) 5'-to G) within a cpg motifically in an individual, such as context at the context of a transpared at 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sjogren's syndrome; pemphigus vulgaris; scleroderma; pernicious anaemia; systemic lupus erythematosus; ankylosing spondylitis; autoimmune skin disease; Grave's disease; inflammatory disease; osteoarthritis; gout; pseudogout; hydroxyapatite deposition disease; asthma; bursitis; tendonitis; conjunctivitis; urethritis; cystitis; balanitis; dermatitis; spinal cord injury; peptic ulcer; hyperlipidaemia; coronary artery disease; migraine; neuroprotective; antirheumatic; antidiabetic; osteopathic; antigout; antiasthmatic; antidiabetic; osteopathic; antigout; antiasthmatic; antiinflammatory; ophthalmological; dermatological; vasotropic; antimigraine; vaccine; gene therapy; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pharmaceutical compositions comprising an immune modulatory nucleic acid comprising a hexamer region, useful for treating an autoimmune disease, emultiple sclerosis, rheumatoid arthritis or insulin dependent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            self-molecule related disease; autoimmune disease; multiple scler rheumatoid arthritis; insulin-dependent diabetes mellitus; autoimmune uveitis; primary biliary cirrhosis; myasthenia gravis;
                    autoimmune diseases (e.g., multiple sclerosis, rheumatoid arthritis, insulin dependent diabetes mellitus, autoimmune uveitis, primary biliary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Example 10; Page 64; 98pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Garren H,

                                                                                                                                                                          This invention relates to a novel active oxygen stress-responsive promoter that effectively induces target gene expression during active oxygen stress under stringent conditions. Specifically, it refers to transforming a plant with a vector containing a promoter that is operably linked to a target gene, and furthermore controls target gene expression in the leaf base, leaf and stalk or root of the plant. The present invention describes inducing expression of one of the following tobacco genes namely NTPXC1, NTPXC2 or NTPXC3 during active oxygen stress conditions in a given transformed plant cell, such as Agrobacterium tumefaciens or Arabidopsis thallana. This oligonucleotide is a PCR primer used to isolate and amplify the tobacco NTPXC1 active oxygen stress-responsive promoter DNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               scleroderma, pernicious anaemia, systemic lupus erythematosus, ankylosing spondylitis, autoimmune skin diseases and Grave's disease); inflammatory diseases (e.g., osteoarthritis, gout, pseudogout, hydroxyapatite deposition disease, asthma, bursitis, tendonitis, conjunctivitis, urethritis, cystitis, balanitis and dermatitis); or other conditions such as spinal cord injury, peptic ulcer, hyperlipidaemia, coronary artery disease and migraine. The present sequence represents a specific example of an immune modulatory nucleic acid predicted to be useful for modulating autoimmune disease which is referred to in an example of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel active oxygen stress-responsive promoter, useful for regulating expression of target gene under active oxygen stress conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   JP2004180678-A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nicotiana tabacum
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       plant; tobacco; ss; active oxygen stress-responsive promoter; leaf base; leaf and stalk; root; NTPXC1; NTPXC2; NTPXC3; transgenic; PCR; primer.

                                                                                                                                                            The oligonucleotides AAT03687-9 are examples of probes used in a novel DNA purification method designated triplex-affinity capture. The method comprises binding an oligonucleotide probe to a double-stranded target nucleic acid under conditions where a triple helix is formed. The probe is attached directly or indirectly to the one half of a specific binding pair e.g. biotin/avidin, antigen/antibody. The other half of the binding pair e.g. biotin/avidin, antigen/antibody. The other half of the binding comparation of the target-probe-binding pair-solid support complex, the target mol. can be recovered by separating the complex from the medium and separating the complex from the target nucleic acid. The method can be used to isolate very large specific intact double strand DNA from a heterogenous mix. This primer was used to assay for transformants separated by the method contains a 45 bp simple T-C repeat which is able to form a triple helix with a (T-C)-contg. probe e.g. AAT03689
                                                                                 Query Match

                                                                                                                                                                                                                                                                                               문
                                                                                                                                                                                                                                                                                                                      The invention relates to an improved method (M) for preparing nucleic CC acid conjugates (C) with synthetic binding units by: (a) synthesizing (C) acid conjugates (C) with synthetic binding units by: (a) synthesizing (C) on a solid support phase using monomer or oligomer units, where the units; (C) is treating the support with a solution of an alkylamine in an inert solvent; (C) treating the support with hydrazine to cleave off and deprotect (C). The patent also claims a supermolecular construct (I) comprising at CC least one synthetic address unit (SAU) attached to a support material (C) comprising an array of discrete locations, where the same SAU is attached to at least two predetermined locations on the support material, and at CC least two conjugates comprising synthetic binding unit (SBU) and a CC uncleic acid (NA), where at least two of the conjugates have the same SBU CC and different NAs, where the SBU of the conjugates have the same SBU coations, and immobilize each of the two different NAs at a different CC location. The method is useful for preparing nucleic acid conjugates with synthetic binding units. The method also enables efficient and specific corting of relatively complex mixtures of nucleic acids to predetermined cortines on a support. This sequence represents an oligonucleotide used in the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an improved method (M) for preparing nucleic CC acid conjugates (C) with synthetic binding units by: (a) synthesizing (C) on a solid support phase using monomer or oligomer units, where the units CC are beta-cyanoethyl-protected on at least one phosphorus of the units; (C) the treating support with a solution of an alkylamine in an inert solvent; and (c) treating the support with hydrazine to cleave off and deprotect (C). The patent also claims a supermolecular construct (I) comprising at CC comprising an array of discrete locations, where the same SAU is attached to at least two predetermined locations on the support material, and at CC least two conjugates comprising synthetic binding unit (SBU) and a culcic acid (NA), where at least two of the conjugates have the same SBU CC and different NAs, where the SBU of the conjugates have the same SBU clocations. The method is useful for preparing nucleic acid conjugates with the SAU at the two predetermined CC sorting of relatively complex mixtures of nucleic acid sto predetermined CC sorting of relatively complex mixtures of nucleic acids to predetermined CC in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                          S
                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to an improved method (M) for preparing nucleic cc acid conjugates (C) with synthetic binding units by: (a) synthesizing (C) con a solid support phase using monomer or oligomer units, where the units (C) are beta-cyanoethyl-protected on at least one phosphorus of the units; (C) treating support with a solution of an alkylamine in an inert solvent; and (c) treating the support with hydrazine to cleave off and deprotect (C). The patent also claims a supermolecular construct (I) comprising at CC comprising an array of discrete locations, where the same SAU is attached to at least two predetermined locations on the support material cc nucleic acid (NA), where at least two of the conjugates have the same SBU cand different NAs, where the SBU of the conjugates have the same SBU coations, and immobilize each of the two different NAs at a different CC location. The method is useful for preparing nucleic acid conjugates with synthetic binding units. The method also enables efficient and specific sorting of relatively complex mixtures of nucleic acids to predetermined cc locations on a support. This sequence represents an oligonucleotide used in the method of the invention.
                                                                                                                                                                                                                                                                                           Matches

                                                                                                                                                                                                                                                                                                                          The sequences given in AAC85321-40 and AAC85342-51 are primers which were used in the construction of baculovirus expression vectors for the expression of the fusion protein PARPIA/PARP2B. This protein contains amino acids 1-652 of hPARPI fused upstream of amino acids 230-583 of hPARP2. The fusion protein coding sequence is given in AAC85341. The protein of the invention, hPARP2, causes the covalent addition of polymers of ADP-ribose to protein targets. hPARP2 activity is induced in many instances of oxidative stress or during inflammation where there is direct damage to the DNA. hPARP2 may be used to identify antagonists which may be used to treat a human having a disorder mediated by PARP2 activity, such as, inflammatory, neurological, cardiovascular, or neeplastic tissue growth disorders. hPARP2 and antibodies to it, can also be used to diagnose these conditions
                                                                                                                                                                                                                                                                         Sequence 21
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New human poly(ADP-ribose) polymerase for treating inflammatory, neurological, cardiovascular, or neoplastic tissue growth disorders, as, arthritis, encephalitis, myocardial ischemia, and leukocyte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Example 3; Page 79; 129pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI; 2001-025335/03.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Christenson E,

                                                                                                                                                                                                                                                                                                                         of the hybridisation are then compared with a comparison sample to establish which genes have altered expression. The method is used to detect genes whose expression is altered by endocrine disruptors such as dioxins, organic halocarbons, phenols, phthalate esters, aromatic hydrocarbons, agrochemicals, organotin compounds, oestrogens, mylex, toxaphene, aldicarb and kepones. The types of genes whose expression may be altered by these disruptors include those involved in nuclear receptor transcriptional coupling, kinase type signal transduction, gonad differentiation, receptor type kinases, intermediate filament markers,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A method for detecting genes whose expression is altered by an endocridisruptor is new and comprises isolation of mRNA from cells, tissue or organism which have come into contact with the endocrine disruptor, an hybridising it with a DNA array containing immobilized gene fragments from genes which may be affected by the endocrine disruptor. The resultion genes which may be affected by the endocrine disruptor.
                                                                                                                                                                                               cell cycle and growth regulation, oncogenes and tumour suppression, apoptosis, DNA damage response, repair and recombination, receptors, cell apoptosis, DNA damage response, repair and recombination, receptors, fate and development regulators, cell adhesion, mortility and invasion, angiogenesis regulation, invasion regulation, cell-cell interaction, Rho family small GTPase regulation and growth factors and cycokines. Sequences AAAS9772-AS9833 represent primers used to amplify the nucleotide sequences of genes which may be affected by an endocrine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Endocrine disruptor; dioxins; organic halocarbon; phenol; agrochemical phthalate esters; aromatic hydrocarbon; organotin compound; oestrogen; mylex; toxaphene; aldicarb; kepones; kinase signal transduction; nuclear receptor transcriptional coupling; gonad differentiation; intermediate filament marker; cell cycle; growth; regulation; oncogene tumour suppressor; apoptosis; DNA damage response; cell adhesion; motility; angiogenesis regulation; invasion regulation; growth factor;

Also described are devices for detecting the binding between the ligands and receptors and methods for detection using these bases. The methods are useful for detection in biochemical and diagnostic assays. The ligands are immobilised in line, so the user only needs to determine the presence or absence of receptor binding, without further processing. AAH41754 to AAH41815 represent primers which are used in an example from the present experts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a substrate having a number of ligands which have been immobilised onto a predetermined region of its surface, in which the region on the substrate has such a shape as to allow the concentration of signals caused by binding of the ligands to receptors in the region toward the receiver. Also described is a substrate for the immobilisation of such ligands. The substrates are applicable in gene engineering for studying relationship between structures and biological activity e.g. effect of endocrine disrupters on various genes and also in investigating the effect of hormones, drugs and other chemicals on the environment. Such substrates are highly sensitive in detecting the ligand-receptor binding, with affinity and reproducibility. The ligand-immobilised substrates can be produced in high density e.g. in microarray form to provide finely tuned results. ADA00221 to ADA00282 represent PCR primers used for amplifying genes in the exemplification of the present revertion.
                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; genomic DNA; polymorphism; genome; allele-specific; primer; probe; hybridisation; polymorphic site; forensic; paternity testing; medicine; phenotypic trait; genetic analysis; genetic mapping; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   where the segment comprises a polymorphic site or an immediately adjacent base, or the complement of the segment. Also described are: (1) an allele specific oligonuclectide that hybridises to a segment of the novelty: (2) an isolated nucleic acid comprising a sequence of the novelty where the polymorphic site within the sequence is occupied by a base other than the reference base indicated in the specification; and (3) analysing a nucleic acid, comprising obtaining a nucleic acid from an individual, and determining a base occupying any one of the polymorphic sites of the novelty. The nucleic acid segments and method can be used to analyse an individuals nucleic acid sequences for the presence of polymorphisms. The presence of the phenotype with a particular polymorphism. The presence of polymorphic sites are useful for, e.g. forensics, paternity testing, correlation of polymorphisms with phenotypic traits and for genetic tags of human genomic DNA fragments containing polymorphic sites. The base occupying the polymorphic site is indicated using IUPAC-IUB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents an allelic ladder, used in the allelic ladder mixture of the invention. The allelic ladder mixture comprises at least one of the following allelic ladders: (i) at least one allele for locus HUMVWFA31/A; (ii) one allele for locus HUMTHO1; (iii) at least one allele for locus HUMVHO1; (iv) at least one allele for locus HUMTHO1; (iv) at least one allele for locus HUMTHO1; (iv) at least one allele for locus HUMTHO1; (iv) an allele for locus D1851. The alleles or allelt ladders are useful in forensic tests for comparison with a sample DNA profile, when the profile is based on analysis of at least one loci of HUMVHFA31/A, HUMTHO1, D8S1179, HUMFIBRA/FGA, D21S11, D18S51 or ANG (amelogenin sex test). DNA profiling is useful in anthropological, paternity, maternity, crime detection and other forensic environments. The new allelic ladders have an improved range and coverage of DNA, and include a number of rare alleles which offers improved identification of an unknown sample
            The invention relates to an isolated polynucleotide (I) of the giant black tiger prawn, Penaeus monodon or expressed sequence tags of the pacific white shrimp, Litopenaeus vanneme (ABN80997-ABN81172), both containing microsatellites sequences including those P. monodon microsatellite sequences given in GenBank AP077550-AF077598. (I), the complementary sequence or fragment and the encoded polypeptide are useful
                                                                                                                                                       Polynucleotides of shi

characterisation of nucleic acid sequences and sequence changes. One method of detection and characterisation comprises: (a) providing: (i) a confolded target having a DNA sequence comprising at least 1 double stranded region and at least 1 single stranded region; and (ii) at least 1 probe complementary to at least a portion of the folded target; and (b) mixing the target and probes so that the probe hybridises to form a probe complex. Also provided are methods for determination of structure formation in nucleic acid targets; for analysing folded nucleic acids targets; and for analysis of nucleic acid structures. The methods can be used for the detection and characterisation of nucleic acid sequences to detect the presence of pathogenic nucleic acid sequences indicative of an infection, the presence of variants or alleles of indicative of an infection, the presence of variants or alleles of identification of the source of nucleic acids found in forensic samples, identification of the source of nucleic acids found in forensic samples, as well as in paternity determinations. The methods allow simultaneous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    analysis of both strands (e.g. the sense and antisense strands) and are ideal for high-level multiplexing. The products produced are amenable to qualitative, quantitative and positional analysis. The methods may be performed in solution or in the solid phase (e.g. on a solid support). The methods are powerful in that they allow for analysis of longer fragments of nucleic acid than current methodologies. Sequences ANV70430-31 represent primers used for the PCR amplification of M. tuberculosis katG gene. This is used in the CFLP analysis of mutations in the katG
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         17-JUN-2000;

The present invention describes a method for identifying oligonucleotides with desired hybridisation properties to nucleic acid targets containing secondary structure. The method comprises amplifying a target nucleic acid having at least one accessible and one inaccessible site. Primers that form an extension product are identified as the oligonucleotides which can interact with the folded target nucleic acid. Oligonucleotides from the present invention can be used in novel detection methods for clinical diagnostic purposes, including the detection and identification of pathogenic organisms (e.g. HIV). The method allows the ability to rapidly analyse nucleic acid structures. ABL46367 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Identifying oligonucleotides hybridizing to nucleic acids containing secondary structure, useful in clinical diagnosis, comprises identifying primers that interact with the target to form an extension product under
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Example 1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             amplification

                                                                               The invention describes a method of analysing nucleic acids comprising providing a target nucleic acid, e.g. hepatitis C virus nucleic acid having non-contiguous single-stranded regions (NCSR) separated by an intervening region, a bridging oligonucleotide capable of binding to the first and second NCSR; a second oligonucleotide binding to a portion of the first NCSR and a cleavage agent, and mixing the contents to form a cleavage structure. The method is useful for analysing nucleic acide, e.g. hepatitis C virus nucleic acid useful for clinical diagnostic purposes and detection and identification of pathogenic microorganisms such as hepatitis C virus. This sequence represents a primer used in the isolation of a Mycobacterium tuberculosis katG gene polynucleotide labelled with terrachlorofluorescein (TET) used to demonstrate the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Analyzing

The PRO polynucleotides and polypeptides have cytostatic activity. The polynucleotides and polypeptides can be used for detecting the presence of PRO polypeptides in samples, for linking bioactive molecules to cells and for modulating biological activities of cells, using the polypeptides for specific targeting. The polypeptide targeting can be used to kill the target cells, e.g. for the treatment of cancers. The polypeptide specific targeting of bioactive molecules to cells. AAC78600 to

CC PRO237, PRO324, PRO351, PRO362, PRO615, PRO531, PRO364, PRO364, PRO618,
CC PRO712, PRO703, PRO792 or PRO474. The Ab can be used in compositions and methods for the diagnosis and treatment of neoplastic cell growth and proliferation in mammals, including humans. Genes and polypeptides encoded by them, that are amplified in the genome of a tumour cell, can be identified and are useful targets for the treatment and prevention of certain cancers and may be used to monitor tumour treatment. Compounds that inhibit the expression or activity of the identified polypeptides can be identified and used as antagonists. Benign or malignant tumours, inflammatory disorders and immunological disorders can be treated.
C AAC58123 to AAC58224 represent hybridisation probes and PCR primers used in the isolation of the human PRO sequences. AAC58241 and AAB24041 to AAB24056 represent human PRO polynucleotide and protein sequences given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                  The invention describes an isolated nucleic acid (I) comprising, or which is at least 80 % sequence identity to, or the full-length coding sequence of, any of 118 300-2100 nucleotide sequences, which encodes its corresponding PRO polypeptide selected from 118 100-700 amino acid sequences, all given in the specification. The nucleic acids and polypeptides are useful for treating inflammatory diseases, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, cancer, or diabetic complications. The nucleic acids are useful as hybridisation probes, in chromosome and gene mapping, and in generating antisense RNA or DNA. The polypeptides are useful as pharmaceuticals, diagnostics, biosensors or bioractors. Both are useful in tissue typing. This sequence represents a novel human secreted and

The invention relates to an isolated secreted and transmembrane polypeptide, designated as PRO polypeptide. The PRO polypeptide is useful for in PRO polypeptide detection methods. The PRO polypeptide is useful for Clinking a bioactive molecule to a cell. The PRO polypeptide or an Intibody against it is useful for modulating a biological activity of a Cc cell. The PRO polypeptide is useful in industrial applications including pharmaceuticals, diagnostics, biosensors and bioreactors. The PRO polypeptide is also useful as a thrombolytic agent, interferon, interflexin, erythropoietin, colony stimulating factor and other cytokines. The PRO polypeptide is useful for treating disease such as CC cancer e.g. colorectal carcinoma; apoptosis related conditions e.g. AIDS, amyotrophic lateral sclerosis; inflammatory disease e.g. asthma, CC amyotrosis; neurodegenerative disease e.g. Alzheimer's disease, CC arkinson's disease; cardiovascular disease e.g. Alzheimer's disease, CC grakkinson's disease; cardiovascular disease e.g. hypertension and CC myocardial ischaemia; kidney disease e.g. renal failure and CC glomerulonephritis; lung disease e.g. pulmonary hypertension, bronchial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          16-DEC-1999

CC polypeptides, and the polynucleotide sequences encoding them. The PRO CC polypeptides are secreted and transmembrane proteins. The PRO CC polypeptides are useful for detecting other PRO polypeptides, for linking CC bioactive molecules to cells expressing PRO polypeptides, for modulating CC biological activities of cells expressing PRO polypeptides, for modulating CC toxin, radiolabel or antibody, and causes apoptosis or death of the cell. CC The PRO polypeptides are useful for treating immune disorders, diabetes or hyper- or hypo-insulinaemia, cardiac insufficiency, nervous system CC disorders, kidney disorders, bone and cartilage disorders or arthritis, CC tumours, and wound healing. The polynuclectide sequences encoding PRO CC polypeptides are useful as hybridisation probes, in chromosome and gene cc mapping, in the generation of antisense RNA and DNA, in the preparation of PRO polypeptides, for generating transgenic animals or knockout CC and in gene therapy. The present sequence represents a probe used in the CC examples of the present invention. Note: The sequence data for this patent was obtained in electronic format directly from the USPTO web site at seqdata.uspto.gov/psipsDIDEntry.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cartilage disorders and immune deficiencies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   459pp; English

                                                                                                                                                                                                                                                                                                                   The invention relates to a new isolated nucleic acid molecule comprises a CC sequence with at least 80% identity to: (a) a nucleotide encoding any of Q4 PRO polypeptides whose sequences are fully defined in the CC specification; or (b) any of 94 nucleotide sequences fully defined in the CC specification; or the full length coding sequence of any these 94 cC nucleotide sequences. Also included are an isolated PRO polypeptide sequence in the CC sporting at least 80% positives when compared to any of the PRO polypeptide sequence cc encoded by the nucleotide deposited with ATCC numbers listed in the CC specification; (b) the PRO polypeptide, lacking its associated signal peptide), a cking its associated signal peptide), a vector comprising the nucleic cc acid molecule, a host cell comprising the vector (and producing a PRO polypeptide), a chimaeric molecule comprising the PRO polypeptide fused to a heterologous amino acid sequence and an anti-PRO antibody. The PRO polypeptide fused or polypeptide fused colorectal cancer, sarcoma, leukaemia or lymphoma), inflammatory disease, renal disease, arthritis, immune-mediated alopecia, colorectal cancer, sarcoma, leukaemia or lymphoma), inflammatory disease, colorectal cancer, sarcoma, leukaemia or lymphoma), inflammatory disease, renal disease, arthritis, immune-mediated alopecia, colorectal cancer, sarcoma, leukaemia or lymphoma), inflammatory disease, arthritis, immune-mediated alopecia, colorectal cancer, sarcoma, leukaemia or lymphoma), inflammatory disease, colorectal cancer, renal disease, arthritis, immune-mediated alopecia, colorectal cancer, sarcoma, leukaemia or lymphoma), inflammatory disease, arthritis, immune-mediated alopecia, colorectal cancer, sepaticis, or multiple sclerosis in mammals. The PRO polypeptides are useful and the diseases. The PRO polypeptides are colorectal cancer constituted and colorectal cancer constituted and colorectal cancer. The propertides are useful as hybridisation probes, or for calcomatical colorectal cancer colorectal cancer cance

Human; secreted and transmembrane protein; PRO; cell death; neuropathy; peripheral neuropathy; diabetic peripheral neuropathy; AIDS-associated neuropathy; Charcot-Marie-Tooth disease;
                                                                                                                                                                                                                                                                                                                                                                                                     The invention describes an isolated secreted and transmembrane (PRO) polypeptide (I). PRO337 polypeptide is useful for detecting PRO4993 polypeptide in a sample, and vice versa. PRO725, PRO700 and PRO739 are useful for detecting PRO1559 polypeptide in a sample. PRO70159 is useful for detecting PRO725, PRO700 and PRO739 in a sample. PRO4993 is useful for linking a bioactive molecule to a cell expressing a PRO337 is useful for linking a bioactive molecule to a cell expressing a PRO337 is useful for linking a bioactive molecule to a cell expressing a PRO337 is useful for linking a bioactive molecule to a cell expressing a PRO337 is useful for linking a bioactive molecule to a cell expressing a PRO335, PRO700 and PRO739 polypeptide, and PRO735, PRO700 and PRO739
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated PRO polypeptides for example extracellular, secreted and membrane bound proteins, useful for modulating the biological activities of cells and for treating, for example diabetes, cancer, rheumatoid arthritis, and hearing loss.
                                                                      Novel human
                                                                                                         08-SEP-2003
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Example

                                                                                              probe; s
                                                                                                                                                                                                                                                                                                                                                                           The invention describes an isolated, secreted and transmembrane polypeptide, termed PRO polypeptide (I). (I) is useful for detecting PRO4993, PRO337, PRO1559, PRO725, PRO700 or PRO739 polypeptide, and for linking a bioactive molecule to a cell expressing the above polypeptides. The bioactive molecule is a toxin, radiolabel or an antibody and causes cell death. (I) is useful as therapeutic agent, in medical and industrial applications e.g. for treating neuropathy, especially peripheral neuropathy, diabetic peripheral neuropathy, AIDS-associated neuropathy, Charcot-Marie-Tooth disease, Refusum's disease, Abetalipoproteinaemia, Tangier disease, Krabbe's disease, Metachromatic leukodystrophy, Fabry's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel secreted and transmembrane polypeptide activity of cell expressing the polypeptide, and as molecular

```
The present invention relates to the isolation of novel human PRO polypeptides, and the polynucleotide sequences encoding them. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are useful for detecting other PRO polypeptides, for linking bloactive molecules to cells expressing PRO polypeptides, for modulating biological activities of cells expressing PRO polypeptides, and for identifying agonists or antagonists. The bloactive molecule maybe a toxin, radiolabel or antibody, and cause cell death. The PRO polypeptides are useful for treating neuropathy and neuropathy related diseases such as Charcot-Marie-Tooth disorder, Refsum's disease, and Krabbe's disease. The polynucleotide sequences encoding PRO polypeptides are useful as hybridisation probes, in chromosome and gene mapping, in the generation of antisense RNA and DNA, in the preparation of PRO polypeptides, for
                                                                                                                         ADC44221 standard; DNA;

Novel secreted and tra encoding them, useful muscle generation and secreted and transmembrane polypeptides and polynucleotides ing them, useful for treating wound healing, tissue growth and e generation and regeneration, amyotrophic lateral sclerosis or

Example 114; SEQ ij ğ 472pp; English.

The invention describes an isolated secereted and transmembrane PRO polypeptide (I). PRO polypeptide such as PRO213, PRO700, PRO320 or PRO615 is useful in biotechnological and medical research, as well as in various industrial applications. PRO polypeptide such as PRO300, PRO866, PRO703, PRO708, PRO320, PRO311, PRO352, PRO381, PRO615, PRO618, PRO772, PRO853, PRO8660 or PRO846 is useful for therapeutic purposes. PRO363 is useful therapeutically in vivo for lessening the effects of viral infection. PRO200 is useful for the treatment of wound healing, tissue growth and muscle generation and regeneration. PRO337 is useful for treating amyotrophic lateral sclerosis, neuropathy, AIDS-associated neuropathy or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC diabetic peripheral neuropathy. A polynucleotide (II) encoding (I) is CC useful for generating transgenic animals or knockout animals which are CC useful in the development and screening of therapeutically useful CC reagents, as probes for generating a pool of sequences for identifying CC related PRO coding sequences, and to construct hybridisation probes for CC mapping the gene which encodes the PRO and for the genetic analysis of CC individuals with genetic disorders, for recombinantly expressing (I) and CC protein electrophoresis purposes, and as therapeutic agents. (I) is a ccentral for screening compounds to identify those that mimic the PRO CC useful for screening compounds to identify those that mimic the PRO CC polypeptide (agonists) or prevent the effect of the PRO polypeptide (antagonists). (I) and (II) are useful for tissue typing. PRO antibodies are useful for tissue typing. PRO antibodies are useful for sasay of sample CC detecting its expression in specific cells, tissues or serum, and for CC affinity purification of PRO from recombinant cell culture or natural CC sources. This sequence represents a human seceretd and transmembrane PRO CC protein associated probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide, a PRO extracellular domain with or without its associated signal peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO antibody. PRO337 polypeptide is useful for detecting a PRO493 polypeptide. Similarly, PRO4993 polypeptide is useful for detecting PRO337
                                                                                                                                                                                                                                                                                         Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ashkenazi

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          polypeptide. PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO1559 polypeptide, and PRO1559 polypeptide is useful for detecting PRO755, PRO700 or PRO739. PRO4993 polypeptide is useful for linking a bloactive molecule to a cell expressing PRO337 polypeptide. The bloactive molecule is the toxin, radiolabel, or an antibody. The bloactive molecule causes death of the cell. PRO337 polypeptide is useful for linking a

Stewart TA,
                     The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid, a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO, fused to a heterologous amino acid sequence, and an anti-PRO antibody. PRO37 polypeptide is useful for detecting PRO493 polypeptide. PRO735 PRO700 or PRO739 polypeptide is useful for detecting PRO1559 polypeptide, and PRO1559 polypeptide is useful for detecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel secreted and transmembrane polypeptides, designated PRO polypeptides, and polynucleotides encoding them useful for treating kidney diseases, bone, cartilage and retinal disorders
                                                                                                                                                                                                                                                                                                                                                                                                          Example 114; SEQ ID NO 573; 468pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WPI; 2003-657582/62.

                                                                                                                                                                    The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide, a PRO extracellular domain with or without its associated signal peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO antibody. PRO337 polypeptide is useful for detecting a PRO4993 polypeptide in useful for detecting a PRO493 polypeptide is useful for detecting a PRO493 polypeptide is useful for detecting a PRO493 polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ferrara

                                                                                                                                                  The invention describes an isolated secereted and transmembrane PRO polypeptide (I). PRO polypeptide such as PRO213, PRO700, PRO320 or PRO615 is useful in biotechnological and medical research, as well as in various industrial applications. PRO polypeptide such as PRO200, PRO866, PRO703, PRO708, PRO320, PRO351, PRO352, PRO381, PRO615, PRO618, PRO772, PRO853, PRO860 or PRO846 is useful for therapeutic purposes. PRO363 is useful therapeutically in vivo for lessening the effects of viral infection. PRO200 is useful for the treatment of wound healing, tissue growth and muscle generation and regeneration. PRO337 is useful for treating amyotrophic lateral sclerosis, neuropathy, AIDS-associated neuropathy or

```
Ct transmembrane protein) having at least 80% amino acid sequence deentity
Ct to an amino acid sequence chosen from 94 fully defined sequence as given
CC in the specification (including PRO lacking its associated signal
CC peptide). Also included are nucleic acids encoding the proteins
CC mentioned above, a vector comprising a PRO nucleic acid). A host cell
CC comprising the vector and producing PRO, a chimaeric molecule comprising
CC pRO fused to a heterologous amino acid sequence, and an anti-PRO
CC antibody. PRO337 polypeptide is useful for detecting a PRO493
CC polypeptide. PRO725, PRC700 or PRC739 polypeptide is useful for detecting a PRO493
CC polypeptide. PRC725, PRC700 or PRC739 polypeptide is useful for detecting PRO493
CC polypeptide. PRC725, PRC700 or PRC739 polypeptide is useful for detecting
CC PRC725, PRC700 or PRC739. PRC4939 polypeptide is useful for linking a
CC polypeptide to a cell expressing PRC4937 polypeptide is useful for linking a
CC polypeptide to a cell expressing PRC4937 polypeptide is useful for linking a
CC molecule is the toxin, radiolabel, or an antibody. The bicactive molecule
CC causes death of the cell expressing PRC4939 polypeptide is useful for linking a
CC polypeptide or anti-PRC493 polypeptide is useful for linking a
CC bicactive molecule to a cell expressing PRC4939 polypeptide is
CC useful for linking a bicactive molecule
CC useful for linking a bicactive molecule
CC useful for linking a bicactive molecule
CC useful expressing PRC4939 polypeptide; and PRC1559 polypeptide is
CC useful expressing PRC4939 polypeptide; and PRC1559 polypeptide is
CC polypeptide or anti-PRC493 polypeptide, where the cell expressing PRC725,
CC prc700 or PRC739 polypeptide. PRC49393 polypeptide is useful for modulating the
CC biological activity of the cell expressing PRC725,
CC prc700 or PRC739 polypeptide is
CC polypeptide is useful for modulating the polypeptide is
CC polypeptide is useful for modulating the polypeptide is
CC polypeptide is useful for modulating the polypeptide. The
CC polypep
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ferrara

useful for treating e.g. lung or breast rheumatoid arthritis, obesity, diabetes, New hypoinsulinemia or wounds. and its encoded secreted and transmembrane polypeptides, tumors, osteoarthritis,
, hyperinsulinemia,

Example 114; SEQ ID NO 573; 452pp; English.

CC transmembrane protein) having at least 80% amino acid sequence as given controlled in the specification (including PRO lacking its associated signal compiled, a pro extracellular domain with or without its associated signal compiled, a PRO extracellular domain with or without its associated signal compiled, a PRO extracellular domain with or without its associated signal comprising the vector comprising PRO, a chimaeric molecule comprising comprising the vector and producing PRO, a chimaeric molecule comprising PRO flued to a heterologous amino acid sequence, and an anti-PRO comprising PRO, a chimaeric molecule comprising PRO flued in a sample suspected of containing PRO4993 polypeptide.

CC Similarly, PRO493 polypeptide is useful for detecting a PRO4993 compressing PRO700 or PRO739, PRO700 or PRO739, PRO700 or PRO739, PRO4993 polypeptide is useful for detecting PRO337 polypeptide, and PRO1559 polypeptide is useful for linking a compression profile is the toxin, radiolabel, or an antibody. The bioactive molecule to a cell expressing PRO493 polypeptide; and pro725, PRO700 or PRO739 polypeptide; and pro725, PRO700 or PRO739 polypeptide; and profile is useful for linking a bioactive molecule to a cell expressing PRO493 polypeptide; and pro725, compressing PRO337 polypeptide; and pro725, pro700 or PRO739 polypeptide; and profile is useful for linking a bioactive molecule to a cell expressing PRO725, pro700 or PRO739 polypeptide; and PRO493 polypeptide; pro725, compressing PRO337 polypeptide; and PRO337 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO725, pro700 or PRO739 polypeptide; and PRO493 polypeptide; pro725, pro700 or PRO739 polypeptide. PRO493 polypeptide or anti-PRO337 polypeptide or anti-PRO337 polypeptide is useful for modulating the biological activity of the cell expressing PRO493 polypeptide; PRO725, biological activity of the cell expressing PRO4933 polypeptide; PRO725, polypeptide; PRO725, profile profile is useful for modulating the profile profile profile profile The invention relates to an isolated PRO polypeptide (secreted or

CC transmembrane protein) having at least 80% amino acid sequence identity CC to an amino acid sequence chosen from 94 fully defined sequences as given CC in the specification (including PRO lacking its associated signal peptide). Also included are nucleic acids encoding the sociated signal CC comprising the vector comprising a PRO nucleic acid), a host cell CC comprising the vector and producing PRO, a chimaeric molecule comprising PRO antibody. PRO337 polypeptide is useful for detecting a producing CC PRO fused to a heterologous amino acid sequence, and an anti-PRO CC antibody. PRO337 polypeptide is useful for detecting PRO337 polypeptide. PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO337 polypeptide, and PRO1559 polypeptide is useful for detecting PRO337 polypeptide. PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO337 polypeptide. PRO725, PRO700 or PRO739 polypeptide is useful for detecting PRO337 polypeptide. PRO725, PRO700 or PRO739 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO337 polypeptide. PRO4993 polypeptide. PRO4993 polypeptide. PRO4993 polypeptide. PRO4993 polypeptide. PRO725, PRO700 or PRO739 polypeptide. PRO337 polypeptide is useful for linking a bioactive molecule co a cell expressing PRO337 polypeptide. PRO337 polypeptide is useful for linking a bioactive molecule co a cell expressing PRO337 polypeptide. PRO339 polypeptide is useful for linking a polypeptide is useful for linking a bioactive molecule co a cell expressing PRO337 polypeptide. PRO337 polypeptide is useful for modulating the soluple professing PRO337 polypeptide is useful for linking a bioactive molecule co a cell expressing PRO337 polypeptide. PRO337 polypeptide or anti-PRO35, PRO700 or PRO739 polypeptide is useful for modulating the biological activity of the cell expressing PRO337 polypeptide is useful for modulating the biological activity of the cell expressing PRO3055 polypeptide. PRO3055 polypeptide. PRO3055 polypeptide. PRO3055 polypeptide. PRO3055 polypepti

Example 114; SEQ ID NO 573; 462pp; English

The invention relates to an isolated PRO polypeptide (secreted or transmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide), a PRO extracellular domain with or without its associated signal peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO antibody. PRO337 polypeptide is useful for detecting a PRO493 polypeptide in a sample suspected of containing PRO493 polypeptide. Similarly, PRO493 polypeptide is useful for detecting PRO337 polypeptide. PRO735, PRO700 or PRO739 polypeptide is useful for detecting PRO4559 polypeptide, and PRO1559 polypeptide is useful for detecting

១១ភ្នំពេលមួយ ១៩១៩១៩១៩១៩១៩១៩៩៥ CC bloactive molecule to a cell expressing PRO337 polypeptide. The bloactive molecule is the toxin, radiolabel, or an antibody. The bloactive molecule control of the cell. PRO337 polypeptide is useful for linking a bloactive molecule to a cell expressing PRO4993 polypeptide, PRO725, control or PRO739 polypeptide are useful for linking a bloactive molecule to a cell expressing PRO4993 polypeptide, PRO735, control or PRO739 polypeptide are useful for linking a bloactive molecule to a cell expressing PRO359 polypeptide; and PRO559 polypeptide is useful for linking a bloactive molecule to a cell expressing PRO735, control or PRO739 polypeptide. PRO4993 polypeptide or anti-PRO337 control or PRO739 polypeptide. PRO4993 polypeptide or anti-PRO337 control or PRO739 polypeptide. PRO4993 polypeptide or anti-PRO337 control or PRO399 polypeptide or anti-PRO559 polypeptide is useful for modulating the biological activity of the cell expressing PRO337 control or PRO739 polypeptide or anti-PRO559 polypeptide; PRO735, control or PRO739 polypeptide or anti-PRO559 polypeptide; PRO735, control or PRO739 polypeptide or anti-PRO559 polypeptide; PRO559 polypeptide; PRO559 polypeptide or anti-PRO559 polypeptide. PRO559 p Query Match Best Local Sequence 24 BP; 1 A; 14 C; 1 G; 8 T; 0 U; 0 Other; PRO725, PRO700 or PRO739. Similarity 88.2%; PRO4993 polypeptide is useful Score Pred. 13.8; DB 1, No. 1.7e+03, Length 24; for linking Gaps рu g in 0

CR transmembrane protein) having at least 80% amino acid sequence identity controlled to an isolated PRO polypeptide (secreted or curvansmembrane protein) having at least 80% amino acid sequence identity controlled. Also included are mucleic acids encotated signal comparising to included are mucleic acids encoding the PRO proteins peptide). Also included are mucleic acids encoding the PRO proteins comprising PRO actioned above, a vector comprising PRO a chimaeric molecule comprising PRO fused above, a vector comprising PRO a chimaeric molecule comprising CR pRO fused to a heterologous amino acid sequence, and an anti-PRO cantibody. PRO337 polypeptide is useful for detecting a PRO proteins propertied. PRO739 polypeptide is useful for detecting PRO339 polypeptide. PRO739 polypeptide is useful for detecting PRO339 polypeptide. PRO739 polypeptide is useful for detecting PRO337 polypeptide. PRO739 polypeptide is useful for detecting PRO337 polypeptide. PRO739 polypeptide provides and PRO337 polypeptide is useful for detecting PRO337 polypeptide. The bioactive molecule to a cell expressing PRO337 polypeptide. The bioactive molecule is the toxin, radiolabel, or an antibody. The bioactive molecule coacell expressing PRO337 polypeptide is useful for linking a bioactive molecule expressing PRO337 polypeptide; and PRO735, a pro739 polypeptide. PRO739 polypeptide are useful for linking a bioactive molecule to a cell expressing PRO337 polypeptide; pro725, a polypeptide is useful for modulating the biological activity of the cell expressing PRO337 polypeptide where the cell is killed. PRO337 polypeptide where the cell as killed. PRO337 polypeptide where the cell as killed. PRO337 polypeptide where the cell as promable promable and promable is useful for modulating the biological activity of the cell expressing PRO337 polypeptide or anni-PRO339 polypeptide promable promable promable activity of the cell expressing PRO339 polypeptide or anni-PRO339 polypeptide promable promable promable promable promable promable promable prom

                                                                                                                                                                                                                                                                                                                                                                 RESULT 2287
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an isolated PRO polypeptide (secreted or curansmembrane protein) having at least 80% amino acid sequence identity to an amino acid sequence chosen from 94 fully defined sequences as given in the specification (including PRO lacking its associated signal peptide, a PRO extracellular domain with or without its associated signal peptide). Also included are nucleic acids encoding the PRO proteins mentioned above, a vector comprising a PRO nucleic acid), a host cell comprising the vector and producing PRO, a chimaeric molecule comprising C comprising the vector and producing PRO, a chimaeric molecule comprising PRO fused to a heterologous amino acid sequence, and an anti-PRO antibody. PRO337 polypeptide is useful for detecting PRO493 polypeptide. Similarly, PRO493 polypeptide is useful for detecting PRO493 polypeptide, and PRO1559 polypeptide is useful for detecting PRO755, PRO700 or PRO739. PRO4993 polypeptide is useful for linking a PRO725, PRO700 or PRO739. PRO4993 polypeptide is useful for linking a

CC to an amino acid sequence chosen from 94 fully defined sequence said sequence consentry (CC in the specification (including PRO lacking its associated signal CC peptide). Also included are nucleic acids encoding the PRO proteins (CC peptide). Also included are nucleic acids encoding the PRO proteins (CC mentioned above, a vector comprising a PRO nucleic acid), a host cell CC comprising the vector and producing PRO, a cid sequence, and an anti-PRO (CC PRO fused to a heterologous amino acid sequence, and an anti-PRO (CC plypeptide in a sample suspected of containing PRO493 polypeptide. (CC similarly, PRO493 polypeptide is useful for detecting PRO337 (CC polypeptide, and PRO1559 polypeptide is useful for detecting PRO337 (CC polypeptide, and PRO1559 polypeptide is useful for detecting PRO337 (CC polypeptide is the toxin, radiolabel, or an antibedy. The bioactive molecule to a cell expressing PRO337 polypeptide is useful for linking a CC packed of the cell. PRO337 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO493 polypeptide. PRO725, PRO700 or PRO739 polypeptide and PRO493 polypeptide. The bioactive molecule to a cell expressing PRO493 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO493 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO493 polypeptide; and PRO1559 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO493 polypeptide is useful for linking a bioactive molecule to a cell expressing PRO493 polypeptide; and PRO1559 polypeptide is useful for linking a bioactive molecule (CC polypeptide) professing PRO493 polypeptide; and PRO1559 polypeptide is useful for CC polypeptide or anti-PRO493 polypeptide; and PRO1559 polypeptide is useful for modulating the bioactivity of the cell expressing PRO493 polypeptide; and PRO1559 polypeptide is useful for modulating the biological activity of the cell expressing PRO725. anti-PRO700 or anti-PRO493 polypeptide is useful for modulating the profession pro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           28-APR-1999;
